MSc Project Opportunity

Assessing Patterns of Genomic Diversity Across Walser-Speaking Populations

We are offering an exciting MSc project with a population genetics focus, touching on topics like human migration, isolation, and genetic differentiation.

In this project you will use bioinformatic tools to analyse genome-wide SNP data from ca. 100 individuals from various Walser communities, complementing the genomic evidence with historical records and linguistic data to shed light on the cultural drivers of population structure.

Project Highlights

- Gain experience analysing large genomic datasets
- Develop your programming skills
- Explore patterns of genetic diversity and drivers of population differentiation
- Integrate interdisciplinary data
- Join a collaborative network of researchers across genetics, anthropology, and linguistic sciences

Computational project (no lab work)
